

StufManager™ PC Software - Save Your Time and Money

Shenitech has introduced StufManager™ PC software to STUF-200x users. This software is aimed to facilitate the use of and to explore the full potential of STUF-200x series ultrasonic flowmeters.

StufManager™ software makes it very easy to connect a STUF-200x flowmeter to a PC through RS-232 link. The software automatically detects the COM port used by the PC and talks to the flowmeter with minimum human interaction. For those users who are not computer guru, this software is definitely a must. It saves time and money.

StufManager™ software is able to acquire the flowmeter data in real-time fashion and display the data on a graphic interface. Besides, it allows the real-time data to be recorded and saved into PC hard drive.

One important feature of StufManager™ is its data logger management functionality, which is very useful for STUF-200H handheld device. Through the user-friendly interface, one can easily configure the STUF-200H data logger. The software allows user to download data from data logger, to format the downloaded raw data into standard format, and to save the data into PC hard drive. One can use Excel or other spreadsheet software to manipulate the data.
